# Motivation and Background

## 12<sup>th</sup> International Conference Waste to Energy 2021, Prague

The motivation of today's developments lies in addition to an efficient pollutant gas separation in topics such as

## 12<sup>th</sup> International Conference Waste to Energy 2021, Prague

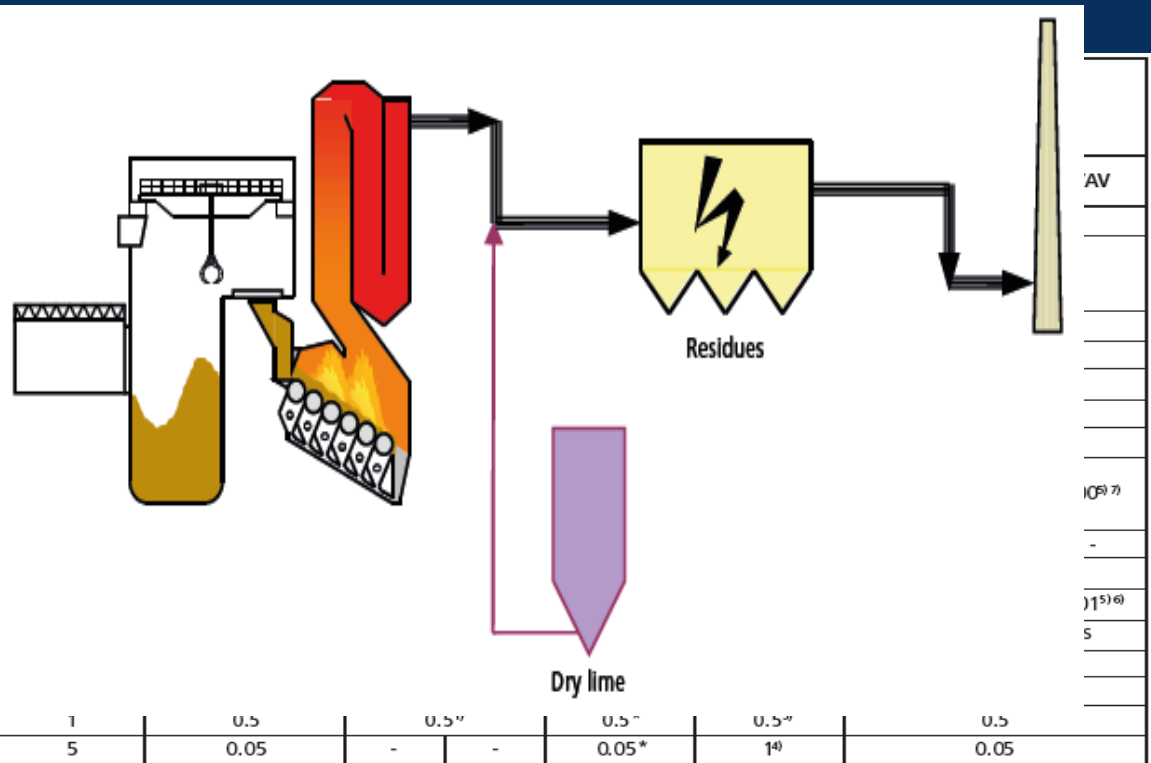

# Overview

Flue gas treatment yesterday and Today

# Development of flue gas treatment systems according the legal requirements using the example of Germany

Pollutant	Unit	TA Luft 1974 version
		General requirements
O <sub>2</sub> -reference percentage	Vol.-% dry	
Dust	mg/m <sup>3</sup>	100
Total Organic Carbon (TOC)	mg/m <sup>3</sup>	-
Hydrogen chloride (HCl)	mg/m <sup>3</sup>	100
Hydrogen fluoride (HF)	mg/m <sup>3</sup>	5
Carbon monoxide (CO)	mg/m <sup>3</sup>	1,000
Sulphur dioxide (SO <sub>2</sub> )	mg/m <sup>3</sup>	-
Nitrogen oxide (NO <sub>2</sub> )	mg/m <sup>3</sup>	-
Ammonia (NH <sub>3</sub> )	mg/m <sup>3</sup>	-
Heavy metals		
Mercury (Hg)	mg/m <sup>3</sup>	-
Dioxins and furans	ng/m <sup>3</sup>	-
Class I	mg/m <sup>3</sup>	20***
Class II	mg/m <sup>3</sup>	50***
Class III	mg/m <sup>3</sup>	75***

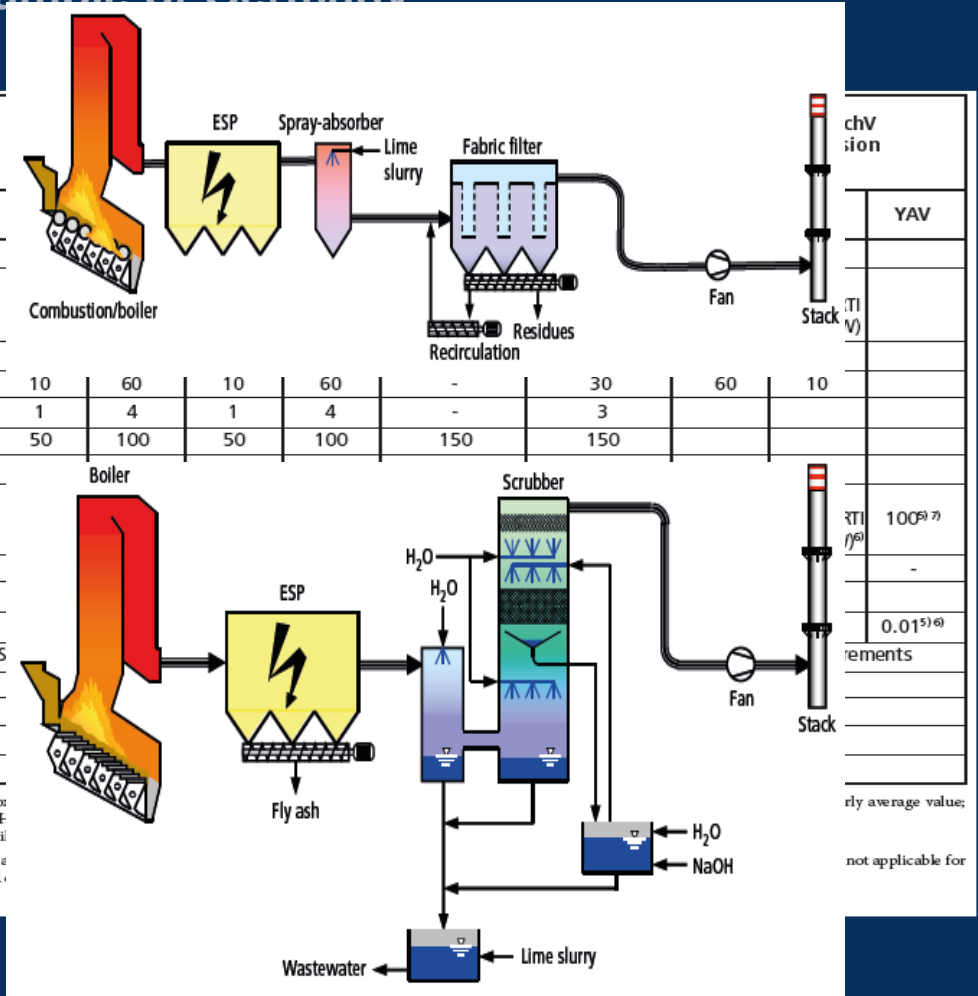

The concentration data is based on standard temperature and pressure, dry state, for each oxygen reference value; DAV indicates daily average value; HHAV indicates half hourly average value; YAV indicates yearly average value; Heavy metals class I: Σ Cd/Tl; Heavy metals class II: Σ Sb, As, Pb, Cr, Co, Ni, Cu, Mn, V, Sn; Heavy metals class III: Σ As, benzopyrene, Cd, Co(aq), Cr(IV)  
 \* not applicable to use of coal, untreated wood only; \*\* combustion capacity > 6t/h or new facilities; \*\*\* related to the former classification  
<sup>1)</sup>excluding Sn; <sup>2)</sup>applicable to Tl (single substance); <sup>3)</sup>applicable to Pb, Co, Ni, Se, Te; <sup>4)</sup>applicable to Sb, Cr, CN, F, Cu, Mn, V, Sn; <sup>5)</sup>not applicable to use of existing plants with RTI < 50 MW; <sup>6)</sup>to be valid as of 2019; <sup>7)</sup>not applicable for existing plants; <sup>8)</sup>applicable to Mercury if the emission value is always < 20% of the requested emission value  
 RTI: Rated Thermal Input

## Development of flue gas treatment systems according the legal requirements using the example of Germany

Pollutant	Unit	TA Luft 1974 version	TA Luft 1986 version
		General requirements	General requirements
O <sub>2</sub> -reference percentage	Vol.-% dry	11	
Dust	mg/m <sup>3</sup>	100	30
Total Organic Carbon (TOC)	mg/m <sup>3</sup>	-	20
Hydrogen chloride (HCl)	mg/m <sup>3</sup>	100	50
Hydrogen fluoride (HF)	mg/m <sup>3</sup>	5	2
Carbon monoxide (CO)	mg/m <sup>3</sup>	1,000	100
Sulphur dioxide (SO <sub>2</sub> )	mg/m <sup>3</sup>	-	100
Nitrogen oxide (NO <sub>x</sub> )	mg/m <sup>3</sup>	-	500
Ammonia (NH <sub>3</sub> )	mg/m <sup>3</sup>	-	-
Heavy metals			
Mercury (Hg)	mg/m <sup>3</sup>	-	-
Dioxins and furans	ng/m <sup>3</sup>	-	-
Class I	mg/m <sup>3</sup>	20***	0.2
Class II	mg/m <sup>3</sup>	50***	1
Class III	mg/m <sup>3</sup>	75***	5

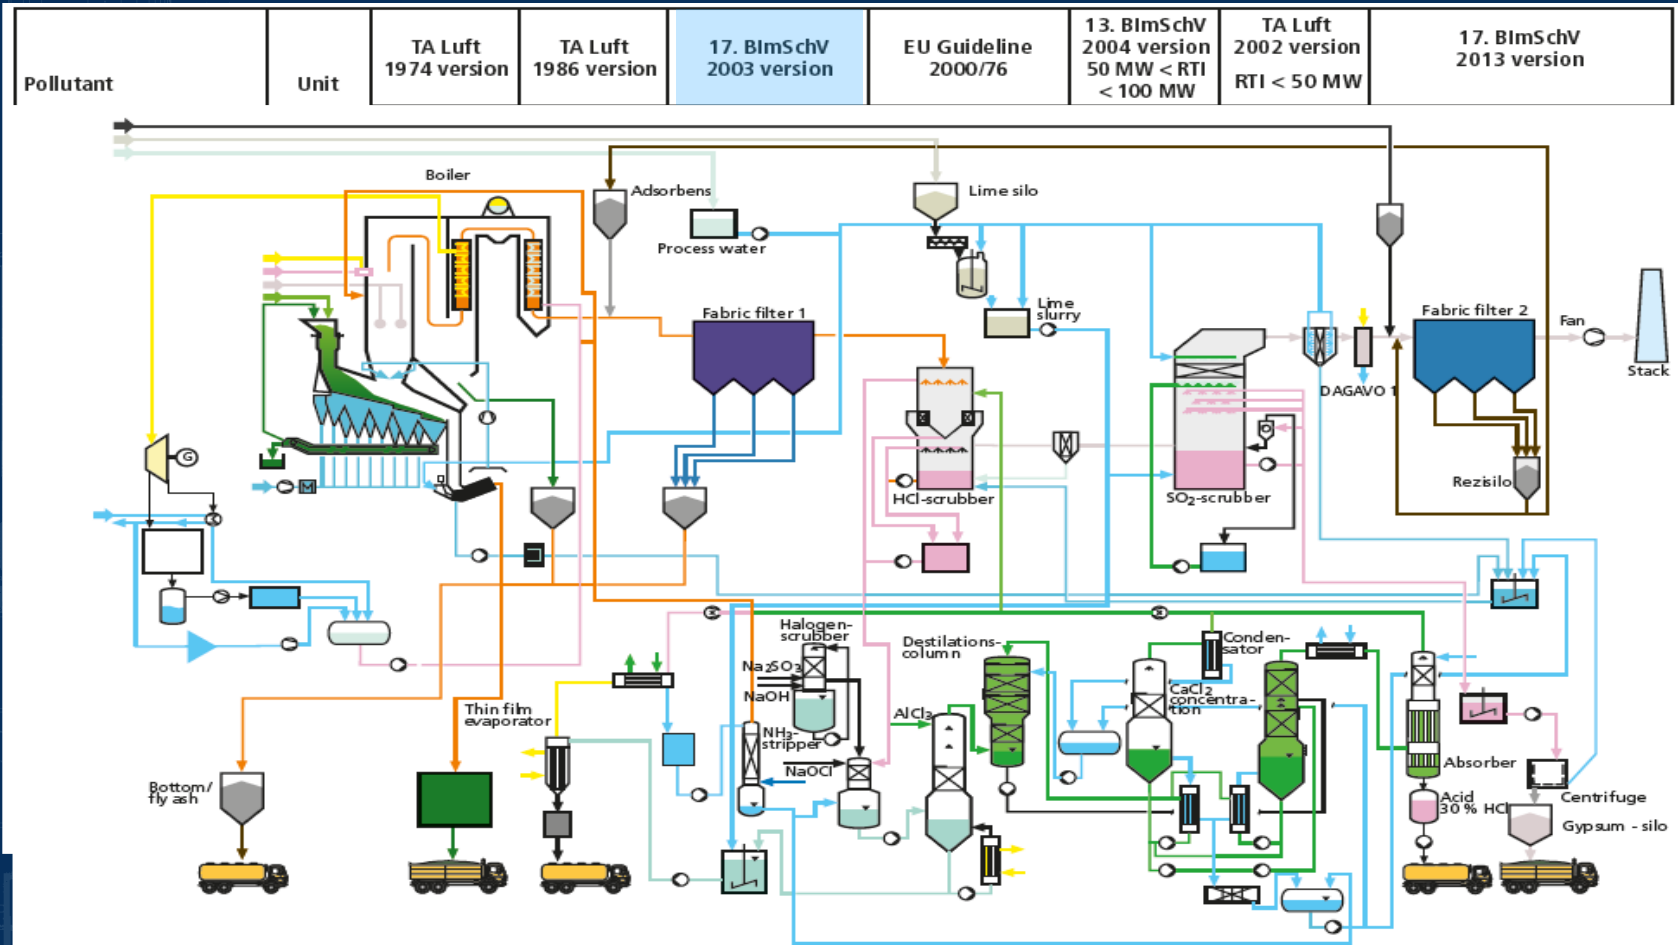

The concentration data is based on standard temperature and pressure, dry state, for each of Heavy metals class I: Σ Cd/Tl; Heavy metals class II: Σ Sb, As, Pb, Cr, Co, Ni, Cu, Mn, V, Sn; F: \* not applicable to use of coal, untreated wood only; \*\* combustion capacity > 6t/h or new facilities; \*\*\* excluding Sn; <sup>1)</sup> applicable to TI (single substance); <sup>2)</sup> applicable to Pb, Co, Ni, Se, Te; <sup>3)</sup> applicable to existing plants; <sup>4)</sup> applicable to Mercury if the emission value is always < 20 % of the requested; RTI: Rated Thermal Input

## Significance of flue gas treatment

What was the experience with such complex plants?

- there was no market for the by-products
- the energy expenditure and plant construction was very high

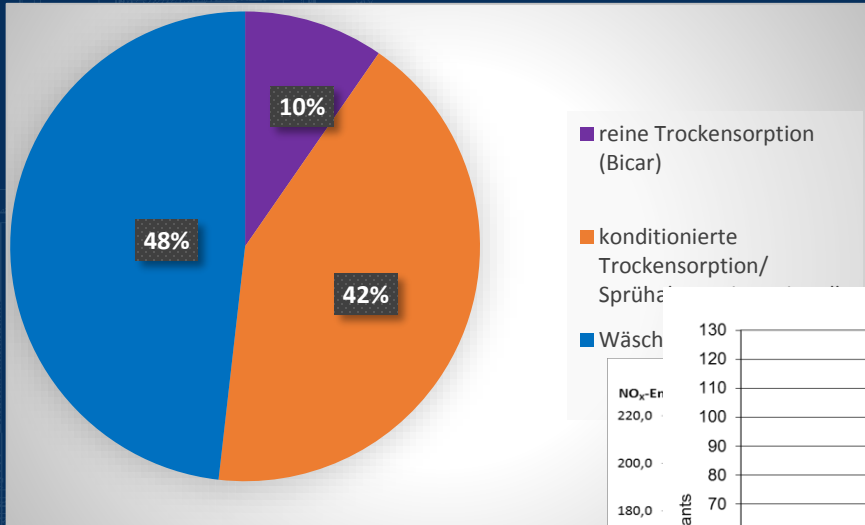

while these insights were gained, waste incineration underwent a metamorphosis from mere waste disposal to energy recovery from waste

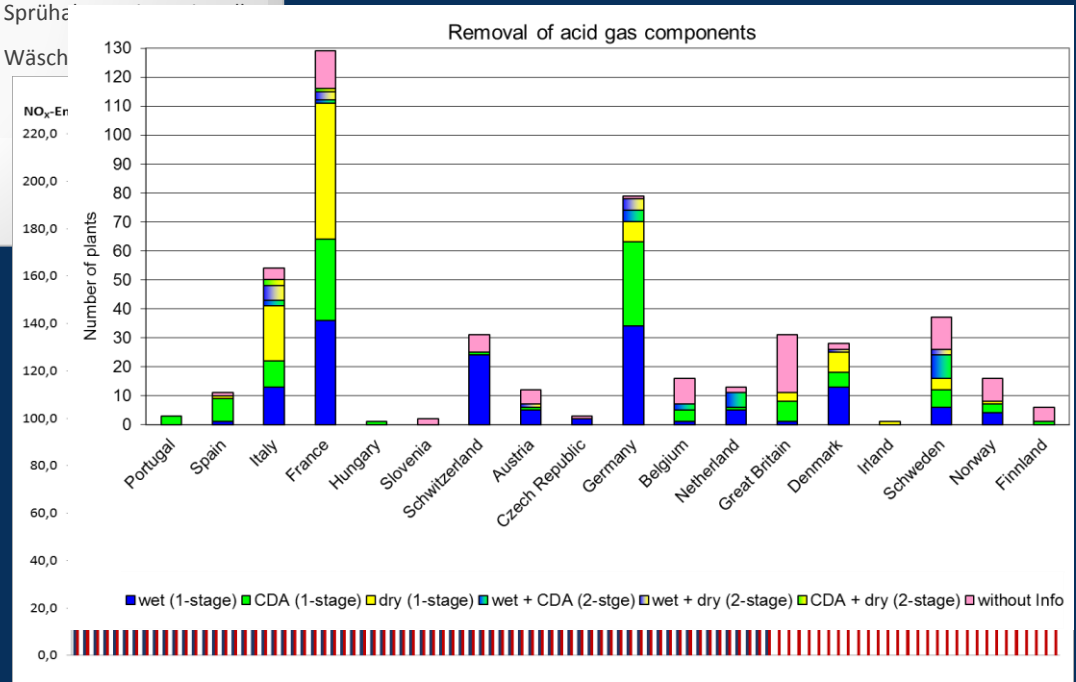

From then on, energy efficiency was in the focus and became an important design criterion both for new and modified plants

### Challenges for flue gas treatment systems in the future

Challenges for flue gas cleaning will continue to be high pollutant removal efficiency and very high efficiency in the use of energy and consumables (minimum consumption of resources)

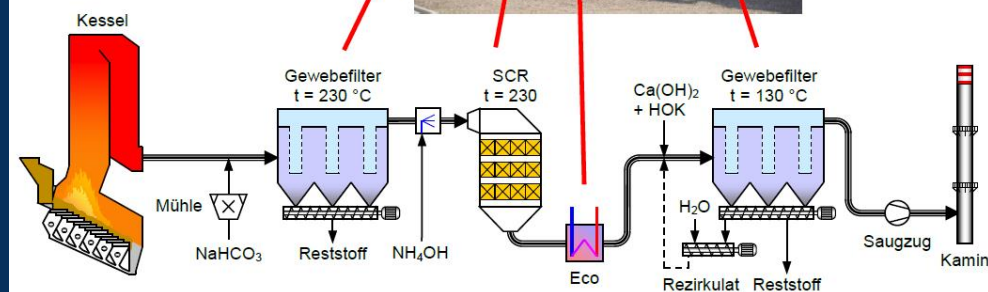

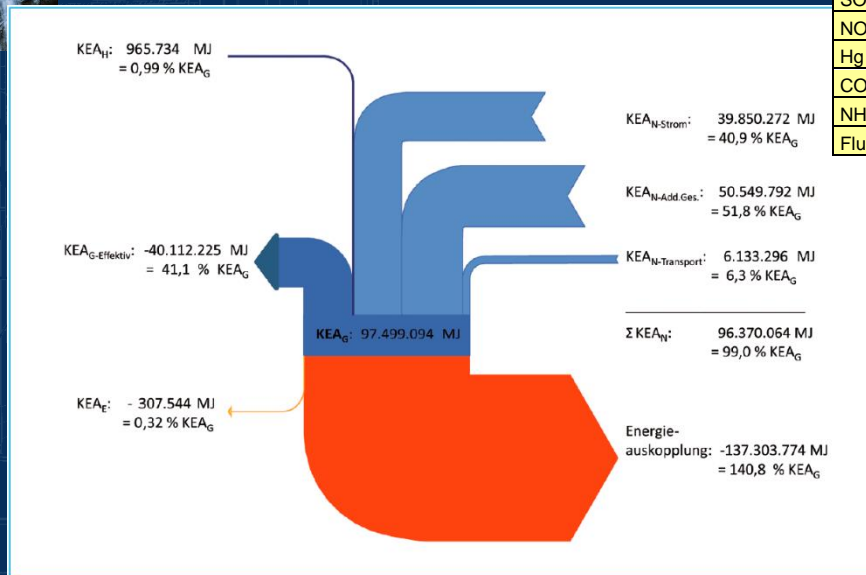

The present-day flue gas cleaning systems are unique in design and their specific configuration often reflects the development of the emission limits over time.

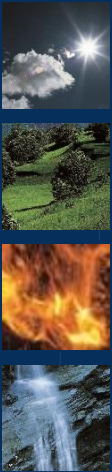

# 12<sup>th</sup> International Conference Waste to Energy 2021, Prague

## Optimized flue gas treatment system in adaptation to the future energy market

# Conclusion

## Conclusion

- The current level of emissions from flue gas purification systems downstream of waste incineration systems partly borders on the confidence levels of the existing measurement technology, so that there is fundamental optimization potential here too, but this does not represent the ultimate challenges.
- In addition to efficient pollutant gas separation, the future challenges lie in topics such as
  - Energy efficiency,
  - Minimization of the input materials up to
  - for recovering valuable substances from flue gas cleaning (e.g. CO<sub>2</sub>).

## Conclusion

- In addition, the location plays an important role, especially for new systems, so that synergies can be used, which must be taken into account when planning the predicted mega-cities.
- It will not be a question of developing completely new systems or processes, but rather the intelligent combination of existing processes and the use of synergies.

# Thank you for your attention!
